Title: Feature Flag & Dynamic Config Manager

Jira backlog with Epics and User Stories & Story point assignments.

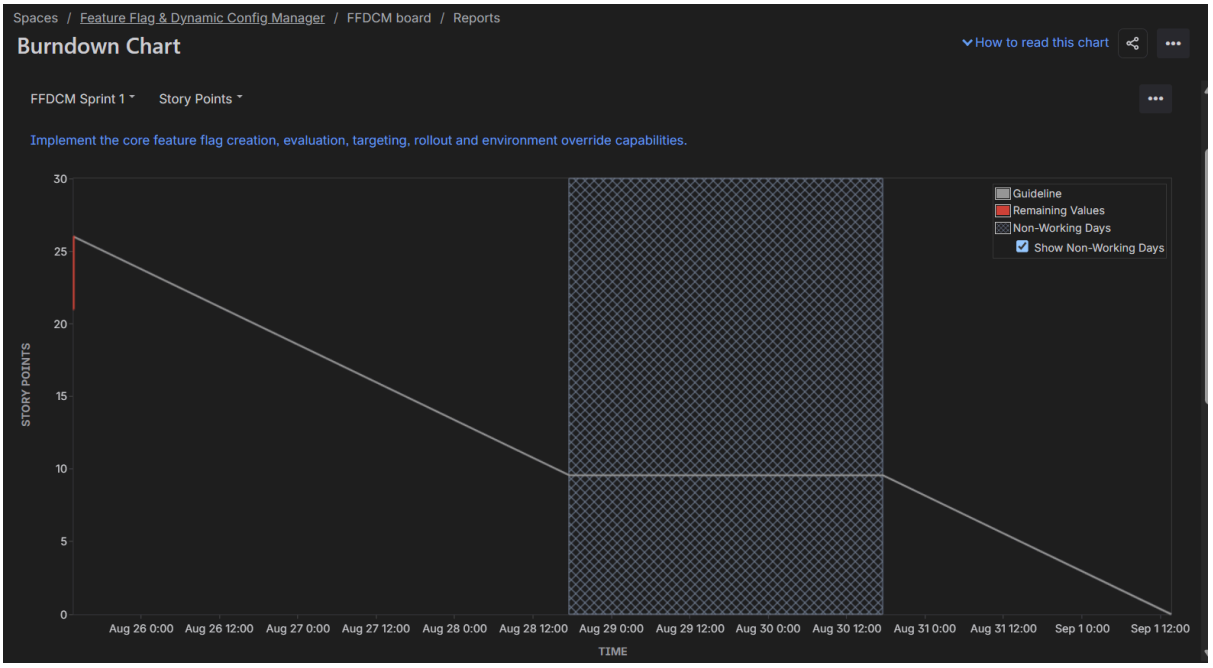

Sprint board (Active Sprint view).

Burndown Chart.

REFLECTIONS:

1. Did your estimations reflect the actual effort?

We can say that the estimates were reasonably accurate overall, although the higher-point stories such as percentage rollout and SDK synchronization involved more complexity and uncertainty.

2. Was your backlog well-prioritized?

Yes. Core feature flag creation and evaluation were given high priority because they are fundamental to the system, while supporting configuration and logging functionality was prioritized accordingly.

3. How did your simulated sprint align with your plan?
Sprint 1 focused on the core evaluation and rollout functionality, while Sprint 2 focused on security, auditing, performance and SDK synchronization. The stories progressed from To Do to In Progress to Done according to the sprint plan.

4. What insights did the burndown chart give about your team’s capacity?
The burndown chart showed how quickly the planned story points were completed and helped assess whether the sprint workload was realistic. A steady decline indicates consistent progress, while sudden drops indicate that multiple stories were completed close together.
